Thermostatic Control Valve

Model J

Typical applications

- Lubricating oil temperature control
- Jacket water high temperature (HT)
- Secondary water low temperature (LT)
- Heat recovery
- Water saving applications
- Boiler inlet temperature control
- Co-generation, cooling towers
- Temperature mixing or diverting
- Engine and compressor cooling system

Model J

Key benefits

- No external power source required
- Simple, low cost installation
- No user setting needed
- 'Fit and forget' solution
- Small number of parts
- Simple maintenance and low cost of ownership
- Robust design capable of high vibration and shock applications
- Easy installation, operates in any mounting position
- Automatic self-sensing control with positive proportional valve action

Accreditations available

- PED Suitable for Group 1 & 2 liquids (Ensure materials are compatible)
- CE Complies with all relevant EU directives

Key features

- Flow rates of 2 8 m³/hr (8 35 US gpm)
- Combinations available:
- Housings in aluminum or bronze
- DN20 (34") pipe size
- Threaded connections
- Tamper-proof temperature settings from 18°C - 113°C (65°F - 235°F)
- Pressure ratings up to 24 bar (348 psi)

Overview

AMOT Model J thermostatic valves are available in a wide selection of sizes and settings to fill a multitude of fluid temperature control requirement These valves may be mounted in any position and use the proven expanding wax principle to actuate the 3-way temperature element assemblies. The JO, JR and JE valves are suitable for oil temperatu control in equipment such as engines, transmission and compressors.

Housing materials Seal materials

Aluminum

Bronze

- Buna N/Nitrile
- Viton
- Neoprene

Leakholes

In some applications, it is necessary to have leak holes drilled in the element to ensure a small flow between ports A and C. Leak holes are available in sizes ranging from 0.8 mm - 6.3 mm (1/32'' - 1/4'').

Temperature settings

A wide selection of element materials, seals and temperatures are available. Follow the equipment manufacturers' guidelines for heating/cooling systems.

Temperature settings are available from 18°C - 113°C (65°F - 235°F). Refer to the temperature and element characteristics table on page 7 for specific temperature settings. In general the temperature guoted is the nominal operating temperature in diverting mode on water systems.

For long life, AMOT valves should not be operated continuously at temperatures in excess of 14°C (25°F) of their maximum continuous rating. If this condition is anticipated then consult AMOT for suitable alternatives.

ts.	The JW is a special 2-way unit used for temperature control of cooling water supplies in 'water saver' applications.
l ire ons	All model J valves use a fully enclosed temperature element that is factory set and provides tamper proof operation.

Element materials

- Bronze, brass and stainless steel
- Nickel plated/stainless steel
- Stainless steel

Please refer to the Leakhole size (G) section of the valve selection table on page 8 to determine the hole size required for specific applications.

For mixing and oil circuits the temperature may be one to two degrees higher due to flow, viscosity and other system parameters.

Elements and seals are available in a variety of materials. These materials are suitable for most applications. Please contact AMOT for material compatibility information.

Heat

Thermostatic Control Valve - Model J

Applications

Diverting Applications

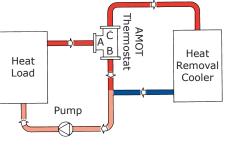

When valves are used for diverting services, the inlet is Port A (temperature sensing port), with Port C being connected to the cooler, and Port B connected to the cooler bypass line.

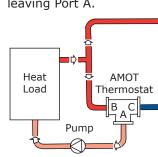

Mixing Applications

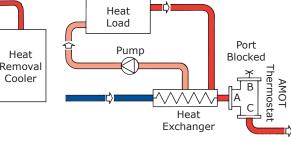

When valves are used for mixing service, Port C is the cold fluid inlet port from the cooler, Port B is the hot by-pass fluid inlet, and Port A the common outlet. Port A is the temperature sensing port and will mix the hot and cold fluids in the correct proportion so as to produce the desired outlet temperature leaving Port A.

2-Way Water Saving **Applications**

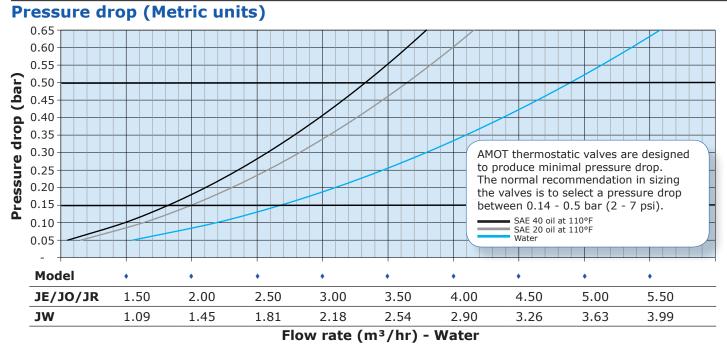

Valve as shown maintains minimum flow through cooler to conserve water. Requires internal leak hole to permit small flow for sensing.

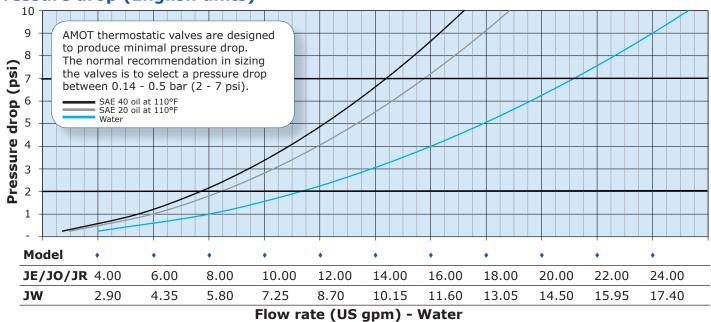

Valve Characteristics

Valve Characteristics Continued

Pressure drop (English units)

Flow coefficient

	low coefficient calculated)							
Model	Kv	Cv						
JE/JO/JR	6.92	8						
JW	5.02	5.8						
Kv = 0.865	Cv	1						
-1156	KV.							

 $\mathbf{K}\mathbf{v}$ is the flow coefficient in metric units. It is defined as the flow rate in cubic meters per hour (m^3/hr) of water at a temperature of 16° Celsius with a pressure drop across the valve of 1 bar. The basic formula to find a valve's Ky is shown below:

$$\frac{3}{\sqrt{DP}} \quad Kv = Q \sqrt{\frac{SG}{DP}} \quad Q = Kv \sqrt{\frac{DF}{SG}}$$

Cv = 1.156 Kv

Cv is the imperial coefficient. It is defined as the flow rate in US Gallons per minute (gpm) of water at a temperature of 60° Fahrenheit with a pressure drop across the valve of 1 psi. The basic formula to find a valve's Cv is shown below:

$$Cv = Q \sqrt{\frac{SG}{DP}} \qquad Q = Cv \sqrt{\frac{DF}{SC}}$$

 $\frac{\overline{OP}}{\overline{SG}}$ $DP = \left[\frac{Q}{\overline{Kv}}\right]^2 SG$ Q = Flow in m³/hr DP = Pressure drop (bar) SG = Specific gravity of fluid (Water = 1.0) Kv = Valve flow coefficient (Metric units)

$$DP = \left[\frac{Q}{Cv}\right]^2 SG \qquad \begin{array}{l} Q = Flow \text{ in US Gallons/Min} \\ DP = Pressure drop (psi) \\ SG = Specific gravity of fluid (Water = 1.0) \\ Cv = Valve flow coefficient (English units) \end{array}$$

Valve Characteristics Continued

Viscosity correction

For the selection of valves for use with more viscous fluids than water, the following must be calculated in addition to using the previously mentioned formulae:

Viscosity

Find the viscosity of the fluid to be used in the valve. This will generally be in centistokes (cST).

ISO grade oil is easy to calculate as the grade no. is the viscosity.

I.e. ISO VG 46 = 46 centistokes at 43° C (110°F)

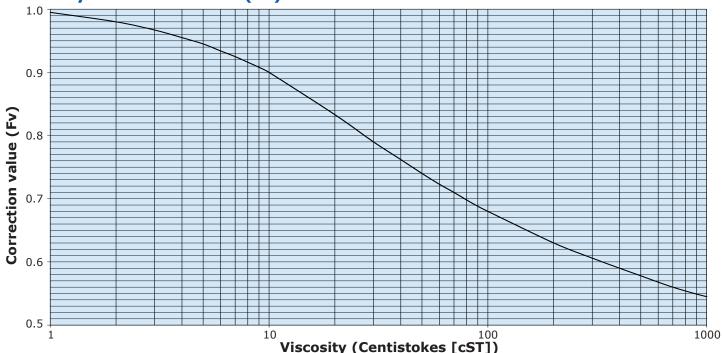

Viscosity correction curve (Fv)

• Viscosity correction

Once the viscosity value has been found, the flow coefficient correction factor can be established using the viscosity correction graph below.

The correction value (Fv) that is produced by the graph should then be multiplied by the original flow coefficient. This gives the corrected flow coefficient, which can then be used in the standard formula.

e.g.: 100 cST = correction factor of 0.68 $0.68 \times \text{flow co.} = \text{corrected flow co.} (\text{Kv or Cv})$

SAE oils viscosities

Engine o	ils		Gear oils	
Oil	Dil cST		Oil	cST
SAE 5W	6.8		SAE 75W	22
SAE 10W	32		SAE 80W	46
SAE 20	46		SAE 85W	100
SAE 20W	68		SAE 90	150
SAE 30	100		SAE 140	460
SAE 40	150			
SAE 50	220			
6 B	394			
8 B	571			

Approximate viscosities of SAE oils at 43°C (110°F) (cST).

Based on leading oil manufacturers' published data.

Thermostatic Control Valve - Model J

Valve Characteristics Continued

Available versions

AMOT Model J thermostatic valve is available in various versions to fit different applications:

- Model JO The most commonly selected version because it is a 3-way low cost unit and fits most applications. Standard versions come in 34" size and use an aluminum body with stainless steel and bronze internals. Standard seals are Buna N/Nitrile.
- Model JR The JR model is a special version of the Model JO for diverting service. It has a pressure relieving feature which will relieve from Port A to Port B at differential pressures above 50 psi. For use in diverting systems when the valve attempts to divert full flow to the cooler but the cold oil in the cooler creates excessive pressure loss. The relief is activated allowing oil flow to bypass the cooler maintaining the oil pressure to the equipment. The model JR is not recommended for mixing service.

235	114	237	107	225	123	253	125	257	

- Model JW The standard version is a 2-way bronze valve for open cooling systems using city, reservoir or river water as the cooling fluid. The valve provides direct temperature control while limiting the amount of water used.
- Model JE A special version of the JO with an external sensing probe. It is an excellent choice for sensing a process fluid temperature while controlling a separate heating or cooling line.

Maintenance and Service Parts

Over time, exposure to foreign chemicals and AMOT recommends fully servicing particulate matter as well as prolonged operation at thermostatic control valves with each extreme conditions may reduce the effectiveness of regularly scheduled major overhaul of the control valve. At such time, AMOT Thermostatic the turbine, engine, compressor or other Valves can be restored to original performance by associated equipment. AMOT recommends a installing an AMOT thermostatic valve service kit or service interval of not more than 24 months to by purchasing and installing new seal(s) and a new ensure optimum valve performance. temperature element.

Service kits are ONLY available for purchase from the Americas and Canada locations. If ordering from the Europe or Asia-PAC locations please purchase seal(s) and element individually to properly service your valve.

Service kits include all new seal(s) and a thermostatic element required for normal maintenance. Whenever an element is replaced, the seal(s) should also be replaced.

Ordering from Americas and Canada Service kits

Service kits are ONLY available for purchase from the Americas and Canada locations.

Service kits are available with seal(s) and element required to service the valve. Order service kits using the AMOT valve part number and nominal temperature setting.

Service kit model number structure

- 1) Omit Valve size (A).
- 2) Replace the Body material (C) and Port connection (D) with "KIT-".
- 3) If Special (J) is not blank, please contact the facility.

Ordering from Europe and Asia-PAC Seal(s)

Order seal(s) using the seal part number which is Order a temperature element using the element identified by the valve model from the AMOT valve part number which is identified by the valve part number; as shown in the seal part numbers model, element/seal material code and nominal table on page 12. Refer to the AMOT valve part temperature setting from the AMOT valve part number that is printed on the valve nameplate and number. Refer to the AMOT valve part number the AMOT valve part number structure on page 8. that is printed on the valve nameplate and the

Thermostatic Control Valve - Model J

AMOT designs and tests all its products to ensure that high quality standards are met. For good product life, carefully follow AMOT's installation and maintenance instructions; failure to do so

- could result in damage to the equipment being protected or controlled. Thermostatic service kits may also be used for adapting valves to new service temperatures. Please request a new nameplate when adapting valves to a new service temperature by contacting the facility.
- Refer to the AMOT valve part number that is printed on the valve nameplate and the AMOT valve part number structure on page 8. The nominal temperature setting is also stamped onto the element flange.
